

A New Way of Thinking.

Nuclear power, along with conservation and alternative forms of generation, helps provide a diversified group of resources to meet our future generation needs.

While conservation is becoming more widely accepted and technologies such as wind and solar energy continue to improve, they simply cannot compete with nuclear power for providing the type of large-scale generation that will be required to meet the growing energy needs of our customers here in South Carolina. Nuclear power, conservation and alternative forms of generation must all play a part in our future energy needs.

We promote energy conservation on our Web site and through public outreach such as our speakers bureau. We have recently rolled out a net metering option for customers who generate their own electricity. We also support research into future energy sources as well as initiatives such as the Plug-In Hybrid Coalition of the Carolinas.

In addition, we rolled out a “green” offering to our customers recently through Palmetto Clean Energy (PaCE), a program designed to encourage the development of renewable energy resources that improve the environment through reduced greenhouse gas emissions. As little as \$4 per month supports the future development of green energy resources such as wind and solar. One-time contributions are also accepted. To learn more, visit sceg.com/pace.
